 - Core idea
 - Significance
- 4 Applications on AES-like Hashing

Nostradamus: Origin and Evolution

Chosen Target Forced Prefix (CTFP) Preimage Resistance¹

- CTFP resembles the setting of a commitment scheme.
- For a hash function H , it should be hard to find a hash value h_T , such that for any prefix P of a known length, the attacker can construct a suffix S that $H(P||S) = h_T$ efficiently.
- The generic CTFP preimage attack on Merkle-Damgård constructions is known as the Nostradamus attack.

Nostradamus: Origin and Evolution

Chosen Target Forced Prefix (CTFP) Preimage Resistance¹

- CTFP resembles the setting of a commitment scheme.
- For a hash function H , it should be hard to find a hash value h_T , such that for any prefix P of a known length, the attacker can construct a suffix S that $H(P||S) = h_T$ efficiently.
- The generic CTFP preimage attack on Merkle-Damgård constructions is known as the Nostradamus attack.

Evolution of Nostradamus Attacks

¹John Kelsey and Tadayoshi Kohno. Herding Hash Functions and the Nostradamus Attack. EUROCRYPT 2006.

Offline Phase

Build a diamond structure with 2^k leaf nodes \rightarrow multi-collisions

- Node x_i : hash values
- Edge $x_i x_j$: a message block m such that $CF(x_i, m) = x_j$

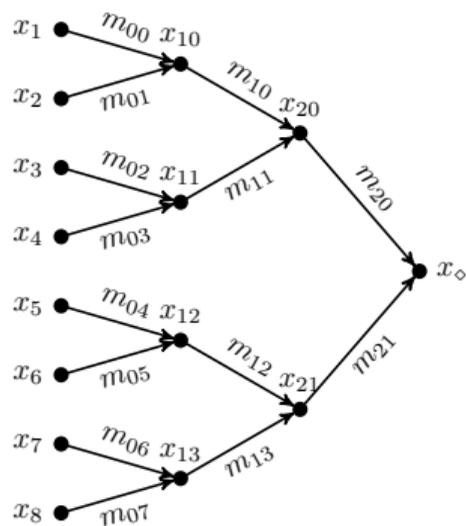

Figure: A diamond structure with 2^3 leaves

Offline Phase

Build a diamond structure with 2^k leaf nodes \rightarrow multi-collisions

- Node x_i : hash values
- Edge $x_i x_j$: a message block m such that $CF(x_i, m) = x_j$

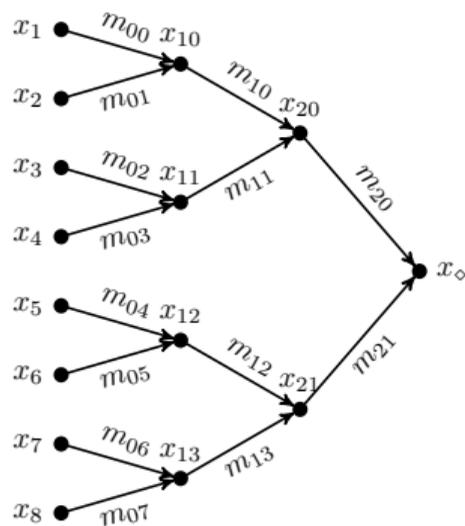

Figure: A diamond structure with 2^3 leaves

Constructing 2^k leaves

Fix $n - k$ bits as constants and enumerate the rest k bits

$n - k$ fixed bits

k free bits

Figure: A construction of the leaf nodes

Online Phase

Find a "link" to diamond structure \rightarrow preimage

- Compute the initial hash value $x_0 = CF(IV, P)$.
- Find M_{link} that links x_0 to any leaf node x_j of the stored diamond structure.

$$CF(x_0, M_{link}) = x_j, \quad 1 \leq j \leq 2^k$$

- Look up the pathway from x_j to h_T as M_j , obtain the suffix $S = M_{link} || M_j$.

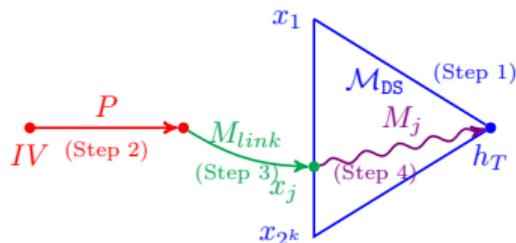

Figure: Nostradamus attack process [BGLP22]

Generic Bounds of Nostradamus

| | Classic | Quantum |
|---------------|--|---|
| Offline | $\mathcal{O}(k^{1/2} \cdot 2^{(n+k)/2})$ | $\mathcal{O}(k^{1/3} \cdot 2^{(n+2k)/3})$ |
| Online | $\mathcal{O}(2^{n-k})$ | $\mathcal{O}(2^{(n-k)/2})$ |
| Balance cond. | $k = n/3$ | $k = n/7$ |
| Overall cplx. | $\mathcal{O}(n^{1/2} \cdot 2^{2n/3})$ | $\mathcal{O}(n^{1/3} \cdot 2^{3n/7})$ |

Generic Bounds of Nostradamus

| | Classic | Quantum |
|---------------|--|---|
| Offline | $\mathcal{O}(k^{1/2} \cdot 2^{(n+k)/2})$ | $\mathcal{O}(k^{1/3} \cdot 2^{(n+2k)/3})$ |
| Online | $\mathcal{O}(2^{n-k})$ | $\mathcal{O}(2^{(n-k)/2})$ |
| Balance cond. | $k = n/3$ | $k = n/7$ |
| Overall cplx. | $\mathcal{O}(n^{1/2} \cdot 2^{2n/3})$ | $\mathcal{O}(n^{1/3} \cdot 2^{3n/7})$ |

Integration of Meet-In-The-Middle (MITM) Attack²

- Use MITM attack to accelerate the online phase
- Shift the optimum towards a more efficient overall time complexity

²Zhiyu Zhang, Siwei Sun, Caibing Wang, and Lei Hu. Classical and Quantum Meet-in-the-Middle Nostradamus Attacks on AES-like Hashing. ToSC 2023

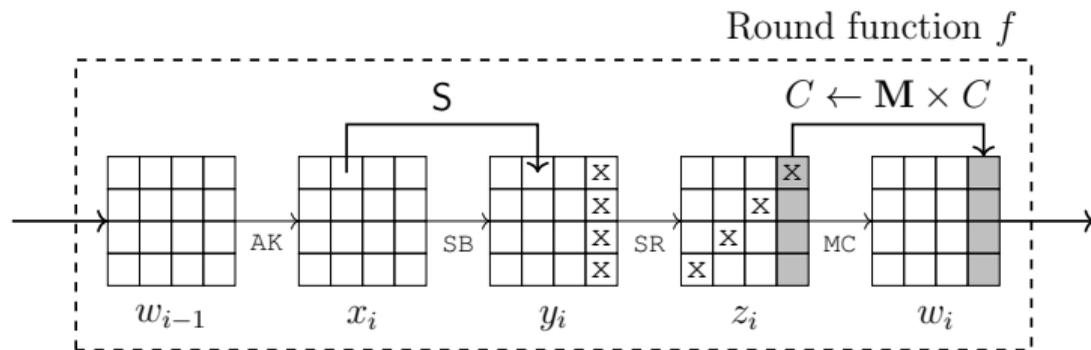

Outline

- 1 Nostradamus Attacks
 - Origin and Evolution
 - Attack Framework
- 2 Preliminaries
 - AES-like Hashing
 - MITM Attacks
- 3 Modified MITM Nostradamus Framework
 - Core idea
 - Significance
- 4 Applications on AES-like Hashing

AES-like Round function

Operators

- SubBytes: byte-wise substitution
- ShiftRows: byte-wise permutation, visualized as a circular left shift
- MixColumns: column-wise left multiplication of a 4-by-4 (MDS) matrix
- AddRoundKey: bit-wise XOR of the round key

Overview of MITM Attacks

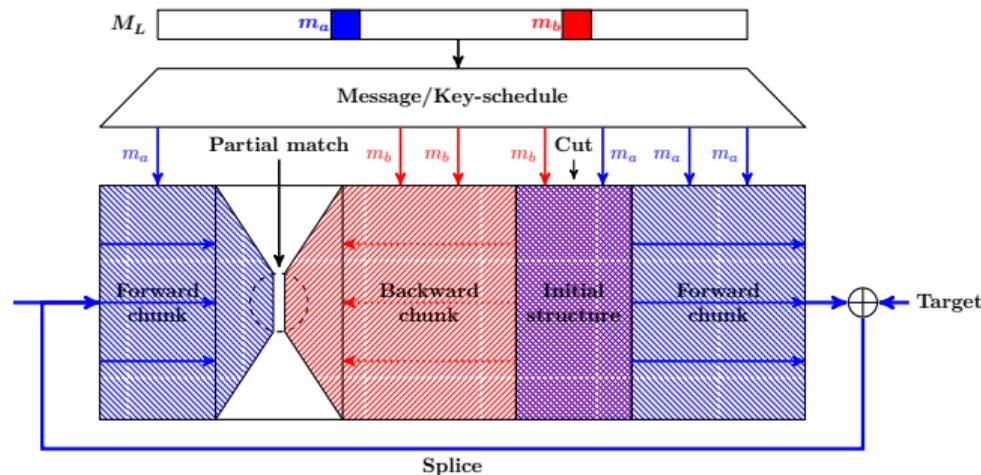

Figure: A high-level overview of MITM attacks by Sasaki

- ① Partition the compression function into two independent chunks
- ② Distribute DoF to both chunks and compute to the matching point
- ③ Obtain candidates that pass the partial match filter

Automatic search of MITM attacks

Automation by MILP

- Model propagation rules and objective in MILP
- Use optimizers to search for the optimal attack strategy

Conventional byte classification

- neutral byte: only known in the current chunk, its influence to the opposite chunk is constant (computational independence)
 -  denotes a neutral byte for forward chunk
 -  denotes a neutral byte for backward chunk
- constant byte: predefined and known in both chunks, denote by 
- unknown byte: not known in either chunk, denote by

Complexity of MITM Nostradamus Attack in [ZSWH23]

| | Classic | Quantum |
|------------------|--|---|
| Offline | $\mathcal{O}(k^{1/2} \cdot 2^{(n+k)/2})$ | $\mathcal{O}(k^{1/3} \cdot 2^{(n+2k)/3})$ |
| Online (generic) | $\mathcal{O}(2^{n-k})$ | $\mathcal{O}(2^{n/2-k/2})$ |
| Online (MITM) | $\mathcal{O}(2^{n-\tau^C})$ | $\mathcal{O}(2^{n/2-\tau^Q})$ |
| Attack cond. | $k < n/3, \tau^C > n/3$ | $k < n/7, \tau^Q > n/7$ |

- τ^C/τ^Q : classic/quantum MITM attack advantage
- Distribute blue/red initial DoF in the target for a multi-target MITM attack
- Lower bound of the diamond structure size (in log 2): $k \geq B^{\text{TAG}} + R^{\text{TAG}}$

Extend the Multi-target Setting

Recall the format of diamond leaves:

Previous approach [ZSWH23]

- Allow only blue, red and gray bytes in target during search (preimage attack)
- Set the gray bytes as the fixed part
- Use the blue/red bytes to match the free part (multi-target)

Modification done in this work

- Search for a **parital preimage attack** instead of a **preimage attack**
- Introduce **white bytes** in target, and use all non-gray bytes to match the free part
- Modify the objective and expand the search space
- Lead to round breakthroughs on AES and Whirlpool

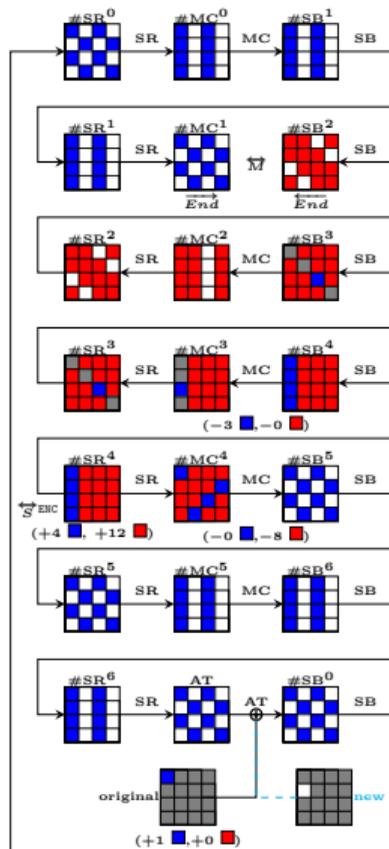

Refined Complexity Analysis

| | Classic | Quantum |
|------------------|--|---|
| Offline | $\mathcal{O}(k^{1/2} \cdot 2^{(n+k)/2})$ | $\mathcal{O}(k^{1/3} \cdot 2^{(n+2k)/3})$ |
| Online (generic) | $\mathcal{O}(2^{n-k})$ | $\mathcal{O}(2^{n/2-k/2})$ |
| Online (prev) | $\mathcal{O}(2^{n-\tau_{prev}^C})$ | $\mathcal{O}(2^{n/2-\tau_{prev}^Q})$ |
| Online (new) | $\mathcal{O}(2^{n-k_w-\tau_{new}^C})$ | $\mathcal{O}(2^{n/2-k_w/2-\tau_{new}^Q})$ |
| Attack cond. | $k < n/3, k_w + \tau_{new}^C > n/3$ | $k < n/7, k_w + \tau_{new}^Q > n/7$ |

- τ^C/τ^Q : classic/quantum MITM attack advantage
- $k_w \leq W^{\text{TAG}}$: length of bits that are not matched in a partial preimage attack
- Lower bound of the diamond structure size (in log 2): $k \geq k_w + B^{\text{TAG}} + R^{\text{TAG}}$

Effect of Our Modification

Offline

$$O(k^{1/2} \cdot 2^{(n+k)/2})$$

Online (prev)

$$O(2^{n-\tau_{prev}^C})$$

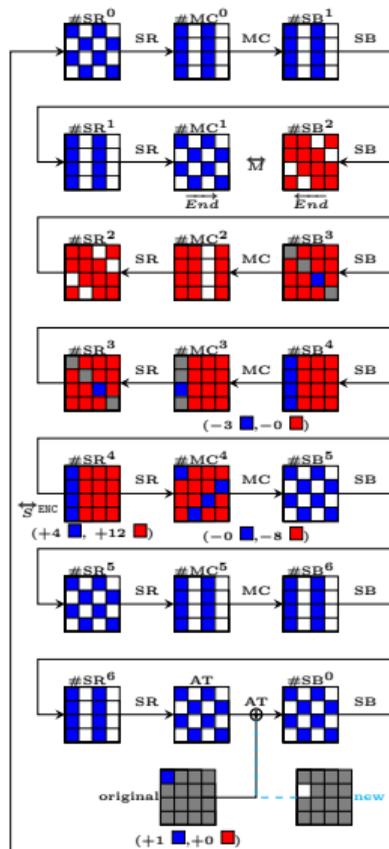

Online (new)

$$O(2^{n-k_w-\tau_{new}^C})$$

Previous

- $k = B^{\text{TAG}} = 8$ (1 byte)
- $Adv = \tau_{prev}^C = \min(d_B, d_R, m)$

Effect of Our Modification
